

IFC Cambricon-LLM Simulator Architecture

Performance path: full Figure 9 rows

Current fit: 8.354% mean abs error, 14.541% max error; max full-row commands 1,544,720.

Validation path: compact representative command streams from the same IFC command semantics

Boundary: the full-row C cycle scheduler owns Figure 9 TPOT. The lower path validates command semantics and resource timing; it does not claim private SSDsim-fork or RTL equivalence.
